

John Edward Fee

john.edward.fee@gmail.com | (919) 972 - 1165 | www.linkedin.com/in/john-fee

Thoughtful data worker with experience wearing analyst, developer, and consultant hats

SKILLS

Quantitative: Regression modeling (including survival analysis, multivariate analysis, robust regression); forecasting/predictive modeling; causal inference; software package development; automated data cleaning + validation

Qualitative: Analytical writing, data storytelling and visualization

Technologies: R (tidyverse), Python (Polars, PySpark), SQL, Git, AWS (RedShift/SageMaker), Databricks, Apache Arrow, R Markdown/Quarto

EXPERIENCE

Data Scientist, Senior Consultant – Accenture Federal Services

January 2024 - Present

Served as a lead analyst on a data team supporting CISA's [Vulnerability Management](#) program. Supported our client with a mixture of data analysis, process improvement, and technical leadership.

- Regularly produced digestible write-ups to document data quality issues, propose software/process improvements, and answer ad-hoc data questions from our client. For data-driven reports, used Rmarkdown/Jupyter notebooks under the hood to facilitate easy updating of metrics and figures.
- Proposed and led efforts to improve data quality by working directly with data providers, adding data validation to ingest pipelines, and improving software development practices.
- Developed software to automate and streamline routine tasks, including two Python packages to help analysts query our Redshift cluster and produce standardized data pulls.
- Served as a SME for our client's data, and frequently provided guidance + resources to team members across the contract.
- Facilitated our client's data migration from AWS to Databricks by converting data pipeline scripts from Pandas to PySpark, assisting other developers with business logic + implementation details, and conducting UAT testing on transitioned tables.

Statistician, Senior Consultant – Guidehouse, Advanced Solutions

Feb 2022 - December 2023

Served as the senior analyst of a data team supporting CISA's [Cybersecurity Directives](#) program, a role which required a mix of data pipeline maintenance, workflow automation, and statistical expertise. Software implementations are in R where applicable.

- Built and maintained a data pipeline that cleaned + normalized vulnerability prevalence data, with the bulk of my effort focused on detecting and flagging data quality issues.
- Created html-based dashboards and reports that integrate with our data pipeline and enabled my non-technical coworkers to explore and summarize vulnerability data.
- Actively participated in/initiated conversations surrounding alignment between metric choice and stakeholder goals. I frequently authored documents (built with R Markdown) that demonstrated through simulation how different procedures address stakeholder questions.
- Spearheaded a push to analyze vulnerability remediation time using survival analysis - a statistical approach to modeling time to event data.

Data & Analytics Modeler, Associate – KPMG, Lighthouse*Feb 2019 - Jan 2021*

Contributed data analysis and programming expertise (Python, R) to multiple engagements.

- Helped run and maintain a Markov-based predictive model for the aging of DLA's Accounts Receivable.
- Co-authored an exploratory analysis of KPMG employee skill profiles identifying relationships between trainings, skills, and performance. Used a combination of classical multivariate stats and graph-based methods to identify skill groups with high ROI.
- Collected COVID prevalence data during early 2020 to feed into a demand forecast model for a multinational grocery store chain. Used DAGs to clarify modeling assumptions, and guided collaborators towards the use of a [compartmental model](#) to model the disease spread.

Data Analyst – Lincoln Park Strategies*Aug - Dec 2018*

Developed probabilistic forecasts for the Michigan state legislature midterm elections using an ensemble of [scikit-learn](#) models trained on voter records and survey data. Leveraged [proper scoring rules](#) to evaluate prediction accuracy and calibration.

EDUCATION

M.S. Statistics – George Washington University*2021*

- Highlighted Projects: Comparative simulation study on the stability of model selection methods, Survival analysis of MDS patients in an immunosuppressive treatment clinical study, Modeling USD/CNY exchange rates with GARCH models.
- Highlighted Coursework: Econometrics 1, Multivariate Analysis 1, Survival Analysis, Bayesian Statistics, Advanced Time Series Analysis, Linear Models, Causal Inference

B.S. Statistics – North Carolina State University*2018*
